

Resubmission kit

Original research · major revision · 2 reviewers · 23 comments answered

This is a redacted sample. It shows the structure and level of detail of a real deliverable. Client names, journal names and identifying particulars have been removed or changed. Ask us and we will send one built around a manuscript like yours.

Triage, approved before drafting

Verdict	Count	What it covers
Concede and revise	17	The reviewer is right and the change improves the paper.
Answer with evidence	5	The manuscript already supports the position, or a reanalysis settles it.
Decline, with a reason	1	External validation cohort — not achievable in a revision cycle.
Flagged to you	1	A suggested citation set showed a coercive pattern. Two of four added on merit.

Two entries, in full

Reviewer 2, comment 4 · conceded

“The sample size is not justified and no power calculation is presented.”

We agree this was not clearly stated and have added it. The target of 240 was set at protocol stage to detect a 12% absolute difference at 80% power and a two-sided alpha of 0.05, assuming a 20% control event rate; 248 were enrolled to allow for loss to follow-up. The registry identifier and its date are cited at p.6, lines 141–149, so the reviewer can confirm this preceded recruitment.

Reviewer 2, comment 11 · declined, with substitutes

“A validation cohort from an independent centre is required before publication.”

We agree external validation would strengthen the work and intend to pursue it; it is not achievable within this revision, as it needs fresh ethics approval and prospective follow-up. In its place we have done three things the underlying concern warrants: split-sample internal validation with 500 bootstrap replications (Methods, p.9); a sensitivity analysis excluding the two highest-volume sites (Supplementary Table S4); and a limitations paragraph stating plainly that generalisability is unestablished (p.19).

Cross-check

Seventeen changes were promised and seventeen are cited by page, section and line. This pass is what catches the error that loses most revisions — a claim in the letter the manuscript does not support.

Section	Change	Cited at
Methods	Sample size and power added; internal validation subsection created.	p.6, p.9
Results	Site-exclusion sensitivity analysis; two figures rebuilt with intervals.	p.12, S4
Discussion	Causal language removed from Abstract and closing paragraph.	line 34, p.18
Introduction	Cut 840 → 610 words; mechanistic paragraph added; remainder to S1.	p.3–4

The next round is included. If the same reviewers come back with follow-up comments on what we answered, those are handled at no further charge.
